

a

Behavioural signature (cell values are raw units)

**b**

Where the variance lives

Panel b is a sequential (Type I) decomposition over 4,800 agent-game cooperation rates, entered in the order shown, so each factor is credited only with what the factors above it leave unexplained; entering model first makes its 9.5% an upper bound. The four design factors together account for 18.7% of the variance. The remaining 81.3% is within-cell: replicates of the identical prompt diverge more than the design factors move the mean.
