

a**b**

A label in a is the nearest canonical rule, not an identity claim. In b, dark = exactly one canonical rule reproduces the whole trajectory, mid = several do and the honest answer is the set, grey = none does and the LSTM names the nearest. The right-hand column of b is the mean number of rounds out of ten on which play departs from its own nearest rule, so Claude's 2.0 means its modal 'archetype' is violated a fifth of the time.
