

**a**

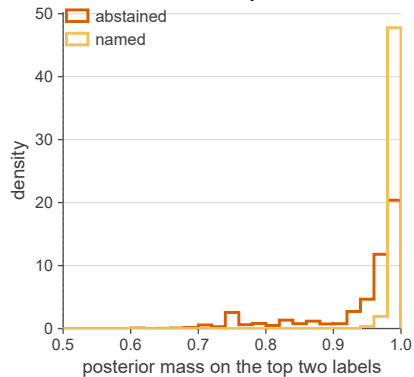

### What the pipeline will and will not name

**b**

### The floor is a convention

**c**

### Abstention is a two-way tie

The 0.90 floor is inherited from the 30-round corpus, where the posterior is bimodal and the cut lands in a valley. Over ten rounds it does not: 51% of the residual sits above 0.95 and the rest is a broad shoulder, so moving the floor from 0.80 to 0.95 moves the abstained share from 0.16 to 0.28. Panel c separates two readings of an abstention -- a network lost among four labels would put about half its mass on the top two, one caught between two rules puts nearly all of it there. The abstained games sit at 0.97, so they are interpolations between two rules, not noise.
