

a two lanes, compared once

collected

the corpus

6 frontier models
5 languages
4 persona pairings
10 payoff scales

what was played

12,000 dyads
24,000 agent-games
240,000 decisions
10 rounds each

read out

memory-one vector
per cell, plus a
hybrid rule-base and
LSTM strategy label

the comparison

the scale is inert
in the theory of the
game, decisive in
the population, and
the corpus matches
neither

computed

the same game

4 canonical rules
AllC, TFT,
WSLS, AIID
error ε per round

solved, not run

expected payoffs
over 10 rounds,
in closed form

finite population

$Z = 100$, Fermi rule,
 $\beta = 0.1$, egttools;
200-digit stationary
distribution

b the knob

	opp A	opp B
you A	$\lambda \cdot 6$	$\lambda \cdot 0$
you B	$\lambda \cdot 10$	$\lambda \cdot 2$

penalties, to be
minimised. Every
entry scaled by λ ,
which changes no
preference and no
best reply.
