

80 settings: $Z \in \{50, 100, 200, 500\}$, $\beta \in \{0.01, 0.05, 0.1, 0.5, 1\}$, $\varepsilon \in \{0, 0.05, 0.1, 0.2\}$, ten payoff scales, each solved at 200 digits. The rise is monotone at every positive ε ; the exceptions are at $\varepsilon = 0$, where the share dips before it rises
